/* ================================================================
 * Voltwise - live ESP32 bridge (Supabase)
 *
 * The ESP32 writes rows to Supabase. This file reads them and drives
 * the existing dashboard. It works in three explicit modes:
 *
 *   live     the device reported within the last 15 s. Every panel
 *            shows real readings; nothing is simulated.
 *   offline  no recent report. Readings are blanked ("--") and the
 *            page says when the device was last seen. The page's own
 *            simulator is stopped, so no invented numbers appear.
 *   demo     the visitor pressed a demo scenario while offline. The
 *            page's simulator runs, and every label says DEMO.
 *
 * It only rewrites text inside elements the page already has, plus
 * one row of export buttons in the analytics section.
 * ================================================================ */
