Abstract - **Access to understandable legal information remains a challenge for many citizens because legal terminology, applicable laws, rights, and complaint procedures can be difficult to identify and interpret. This paper proposes Legal Mate AI, a domain-specific Indian Legal Artificial Intelligence system designed to provide accessible and source-grounded preliminary legal information and procedural guidance. The proposed system combines Artificial Intelligence (AI), Natural Language Processing (NLP), and Retrieval-Augmented Generation (RAG) to understand user legal queries, identify the relevant legal domain, and retrieve appropriate information from a curated Indian legal knowledge base. A domain-specific legal AI model is proposed using curated legal problem descriptions, categories, intents, and question-answer examples.The system is designed to explain legal rights, identify potentially relevant Acts and sections, analyze uploaded legal documents, generate structured complaint drafts, provide evidence and document checklists, and guide users through possible next steps. English and Tamil language support is also proposed to improve accessibility. The system is intended to provide preliminary legal information and procedural guidance and is not designed to replace professional legal representation.**

Keywords: Artificial Intelligence, Legal AI, Natural Language Processing, Retrieval-Augmented Generation, Legal Information Retrieval, Indian Legal AI, Complaint Generation.

I. INTRODUCTION

Legal information is often difficult for ordinary citizens to understand because legal documents and procedures contain specialized terminology and require knowledge of applicable laws and processes. A person facing a legal issue may not know which legal domain is relevant, which Act or section may apply, what documents are required, or what procedural steps can be considered.

Recent developments in Artificial Intelligence and Natural Language Processing have created opportunities for developing systems that can assist users in understanding domain-specific information. In the legal domain, AI can be used to process legal documents, understand natural-language queries,

retrieve relevant information, and present information in a structured form.

Legal Mate AI is proposed as a domain-specific Indian legal assistance and companion system. Its primary objective is to make preliminary Indian legal information easier to access and understand. The proposed approach combines NLP-based query understanding with retrieval from a curated Indian legal knowledge base.

The system accepts a user's legal question or an uploaded legal document. NLP techniques are used to understand the query and identify its relevant legal domain. RAG is then used to retrieve appropriate information from the curated knowledge base. A domain-specific Legal AI model uses curated legal problem descriptions, categories, intents, and question-answer examples to support the generation of structured guidance.

The proposed outputs include potentially relevant legal rights, Acts and sections, document analysis, complaint drafts, evidence or document checklists, and possible next steps. English and Tamil support are proposed to improve accessibility.

The system is positioned as an information and procedural guidance tool rather than a replacement for professional legal representation.

II. LITERATURE SURVEY

Research in Legal AI has explored Natural Language Processing, legal entity recognition, transformer-based models, retrieval systems, and AI-assisted legal consultation.

A. Legal Natural Language Processing

Quevedo et al. presented a comprehensive systematic mapping study of Legal Natural Language Processing covering advances and applications in legal NLP. The study identified major Legal NLP tasks, research trends, and research gaps. It also highlighted challenges associated with legal documents and the availability of suitable datasets.

B. Legal Named Entity Recognition

Liu et al. proposed a named entity recognition approach for legal instruments using improved few-shot learning. The work addressed the difficulty of obtaining large amounts of labelled legal data and investigated approaches including BERT, few-shot learning, Viterbi-based methods, and data augmentation. The study primarily focused on Chinese legal data, indicating the need for further domain and language-specific development.

C. AI-Based Legal Assistance

Al-Shareef proposed CHRExpert, an AI-driven court of human rights expert assistant designed to assist legal practitioners in analysing complex case documents. The work used transformer-based approaches and a relevant legal dataset. The study also highlighted limitations related to judicial discretion and novel cases.

D. SmartLaw Advisor

Almutairy et al. proposed SmartLaw Advisor, an AI-powered legal consultation and contract analysis system for Saudi Arabia. The methodology incorporated Gemini 1.5 Flash, RAG, a localized legal knowledge base, semantic retrieval, reranking, OCR, PDF processing, and clause-level contract analysis. The work demonstrates the use of retrieval-based AI

for localized legal assistance while identifying challenges such as retrieval errors, hallucinations, and changing laws.

Research Gap

The reviewed studies demonstrate the potential of AI, NLP, transformers, and RAG for legal applications. However, the supplied project focuses specifically on a localized Indian legal information system, with proposed support for English and Tamil, structured complaint assistance, document analysis, evidence checklists, and procedural guidance.

The proposed Legal Mate AI therefore focuses on combining a curated Indian legal knowledge base with NLP, RAG, and a domain-specific legal AI model.

III. PROBLEM IDENTIFICATION

The major problems addressed by the proposed system are:

Individuals often face difficulties in understanding complex legal terminology, procedures, and formal requirements. They may also struggle to identify the appropriate legal domain related to their problem and determine which Acts, laws, or sections are potentially applicable. Access to clear, reliable, and source-grounded preliminary legal information is often limited, making it difficult for users to understand their legal rights and possible actions. In addition, many individuals lack structured assistance for preparing legal documents and may find it challenging to organize the required facts, details, and evidence into a proper format. Preparing a clear and structured complaint draft can therefore be time-consuming and confusing, especially for people without prior legal knowledge.

1. Lack of clear evidence and document checklists.
2. Difficulty understanding possible procedural next steps.
3. Need for accessible legal information in both English and Tamil.

These problems form the basis for developing an AI-assisted system capable of converting natural-language legal queries into structured and understandable preliminary legal information.

IV. OBJECTIVES

The major objectives of Legal Mate AI are:

1. To provide accessible and source-grounded preliminary legal information based on Indian laws.
2. To understand natural-language legal queries.
3. To identify the relevant legal domain associated with a user's query.
4. To retrieve appropriate information from a curated Indian legal knowledge base.
5. To explain potentially relevant legal rights.
6. To identify potentially relevant Acts and sections.
7. To analyse uploaded legal documents.
8. To generate structured complaint drafts.
9. To provide evidence and document checklists.
10. To guide users through possible procedural next steps.
11. To propose English and Tamil language support.

The objectives are intended to improve accessibility to preliminary legal information while maintaining the distinction between AI-generated information and professional legal representation.

V. PROPOSED SYSTEM

The proposed Legal Mate AI architecture consists of five major stages:

User Query / Document → NLP Understanding → RAG Retrieval → Legal AI Model → Structured Guidance

A. User Query / Document

The system accepts either a natural-language legal question or an uploaded legal document. The input represents the user's legal problem or the document that requires preliminary analysis.

B. NLP Understanding

The NLP component processes the user's input and attempts to understand the query. It identifies the relevant legal context or domain before information retrieval takes place.

C. RAG Retrieval

The Retrieval-Augmented Generation component retrieves relevant information from the curated Indian legal knowledge base. This retrieval-based approach is intended to provide source-grounded information rather than relying only on general model knowledge.

D. Domain-Specific Legal AI Model

The proposed Legal AI model uses curated legal problem descriptions, categories, intents, and question-answer examples. These resources are intended to help the system interpret legal queries and generate structured responses relevant to the Indian legal domain.

E. Structured Guidance

The final stage converts the retrieved and interpreted information into structured guidance. The intended outputs include:

- Legal rights
- Potentially relevant Acts and sections
- Legal document analysis
- Complaint drafts
- Evidence/document checklists
- Possible next steps

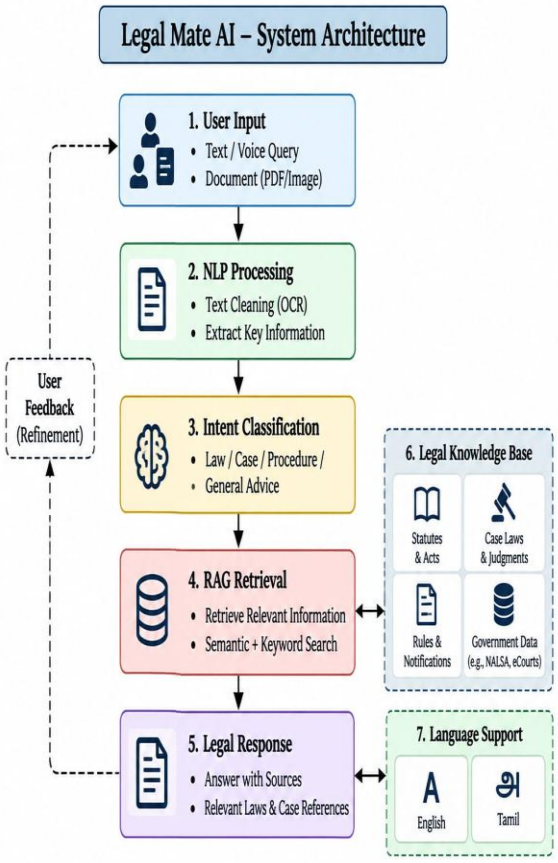

Fig 1 SYSTEM ARCHITECTURE

VI. METHODOLOGY

Step 1: User Input

The user provides a legal question or uploads a legal document.

Step 2: Query Understanding

NLP-based processing is used to understand the user's query and identify the relevant legal domain.

Step 3: Knowledge Retrieval

The RAG component retrieves relevant information from the curated Indian legal knowledge base.

Step 4: Domain-Specific Processing

The Legal AI model processes the retrieved information together with curated legal problem descriptions, categories, intents, and question-answer examples.

Step 5: Structured Response Generation

The system generates structured preliminary guidance. Depending on the input, this may include relevant rights, potentially applicable Acts or sections, document analysis, complaint drafts, evidence/document checklists, and possible next steps.

Step 6: Language Support

English and Tamil support are proposed to make the system accessible to a broader range of users.

The overall methodology described in the source follows the sequence of user input, NLP understanding, RAG retrieval, domain-specific processing, and structured guidance generation.

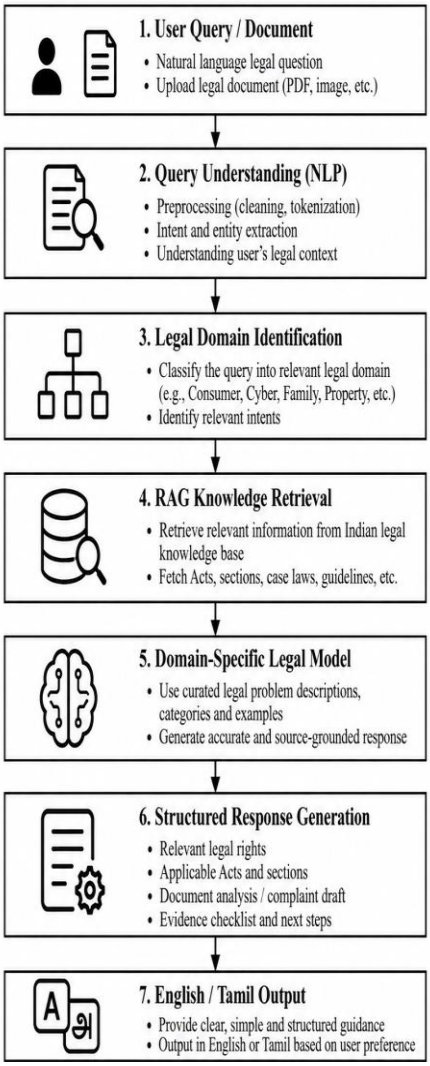

Fig 2 OVERALL METHODOLOGY FLOW

VII. KNOWLEDGE BASE AND DOMAIN-SPECIFIC MODEL

A key component of the proposed system is the curated Indian legal knowledge base. The system is intended to retrieve relevant legal information from this knowledge base based on the user's query.

The proposed domain-specific model is designed around:

- Legal problem descriptions
- Legal categories
- User intents

- Question-answer examples
- Relevant legal information

The combination of a curated knowledge base and domain-specific examples is intended to improve the relevance of retrieved information and the structure of generated responses.

The system therefore follows a retrieval-oriented architecture in which relevant information is retrieved before structured guidance is generated.

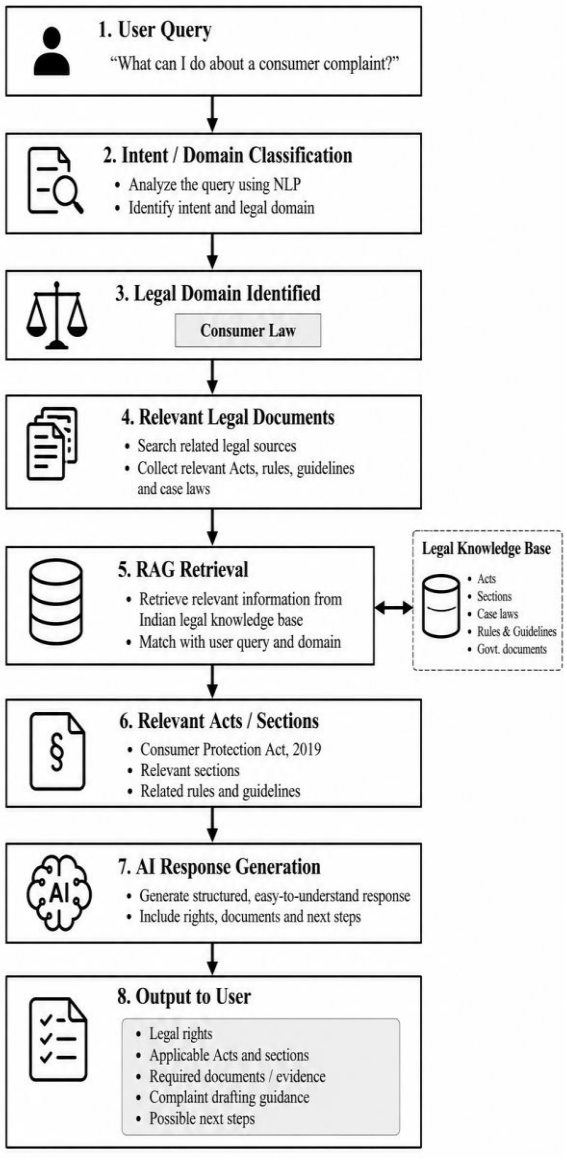

Fig. 3. Legal query processing and retrieval workflow.

VIII. FUNCTIONAL FEATURES

The proposed Legal Mate AI system includes several functional capabilities.

1. Legal Query Understanding

The system accepts natural-language descriptions of legal problems and attempts to identify the relevant legal domain.

2. Legal Information Retrieval

RAG retrieves relevant information from the curated Indian legal knowledge base.

3. Rights and Acts/Sections Identification

The system can present potentially relevant legal rights and Acts or sections based on the retrieved information.

4. Document Analysis

Users can upload legal documents for preliminary analysis.

5. Complaint Draft Generation

The system can generate structured complaint drafts based on the information supplied by the user.

6. Evidence and Document Checklist

The system can provide a structured checklist of potentially relevant evidence or documents.

7. Next-Step Guidance

The system can explain possible procedural next steps in a structured manner.

8. English and Tamil Support

English and Tamil support are proposed to improve accessibility.

These capabilities are described as proposed or intended functionality in the supplied paper rather than as

experimentally validated performance results.

IX. RESULTS AND DISCUSSION

The supplied project material describes the proposed capabilities of Legal Mate AI but does not provide measured experimental results or accuracy values for the proposed Indian Legal AI system. Therefore, quantitative performance claims are not made in this paper.

The intended functional outputs of the system include:

- Identification of a relevant legal domain.
- Retrieval of potentially relevant legal information.
- Identification of potentially applicable Acts and sections.
- Preliminary legal document analysis.
- Structured complaint drafts.
- Evidence and document checklists.
- Possible next-step guidance.
- English and Tamil language support.

The proposed system is designed to provide source-grounded preliminary legal information and procedural guidance. It should not be interpreted as providing professional legal representation.

For future implementation, the system can be evaluated using suitable datasets and metrics for query classification, retrieval quality, document analysis, and response generation. Such measurements are not included in the supplied project material.

MODEL	ACCURACY	F1 SCORE
TF-IDF + LinearSVC	67.50%	61.11%
DistilBERT (Proposed)	75.63%	69.20%

Table.1. PERFORMANCE COMPARISON OF CLASSIFICATION MODELS

Table 1 presents the performance comparison between the baseline TF-IDF + LinearSVC model and the proposed DistilBERT model. The TF-IDF + LinearSVC model achieved an accuracy of 67.50% and an F1 score of 61.11%, while DistilBERT achieved a higher accuracy of 75.63% and an F1 score of 69.20%. The results indicate that the proposed DistilBERT model performs better than the baseline model for fine-grained legal intent classification.

X. ADVANTAGES OF THE PROPOSED SYSTEM

The proposed system provides several intended benefits:

1. **Accessibility:** Makes preliminary legal information easier to access.
2. **Natural-language interaction:** Allows users to describe problems using ordinary language.
3. **Source-grounded retrieval:** Uses RAG to retrieve information from a curated knowledge base.
4. **Domain specificity:** Focuses on Indian legal information.
5. **Structured assistance:** Organizes information into rights, Acts/sections, documents, complaints, and next steps.
6. **Document support:** Allows uploaded legal documents to be considered.

7. **Complaint assistance:** Supports structured complaint drafting.
8. **Language accessibility:** Proposes English and Tamil support.
9. **Procedural guidance:** Helps users understand possible next steps.

XI. LIMITATIONS

The proposed system has several important limitations.

First, legal information can change over time, requiring the underlying knowledge base to be updated. The literature reviewed in the project also identifies changing laws, retrieval errors, and hallucinations as challenges for legal AI systems.

Second, legal interpretation can depend on specific facts and circumstances. Therefore, automatically generated information should not be treated as a substitute for professional legal advice.

Third, the supplied project material does not provide experimental accuracy measurements for the proposed Indian Legal AI system. Therefore, the effectiveness of the complete system remains to be evaluated through implementation and testing.

Finally, the proposed English and Tamil support requires appropriate language-specific legal data and validation.

XII. FUTURE ENHANCEMENT

Future development of Legal Mate AI can follow the proposed project phases:

Phase 1 — Legal Knowledge Curation

Develop and organize the Indian legal knowledge base and example data.

Phase 2 — NLP Query Understanding

Develop query understanding and legal-domain identification capabilities.

Phase 3 — RAG Integration

Integrate the RAG pipeline with the curated Indian legal knowledge base.

Phase 4 — Extended Functionalities

Add document analysis, complaint drafting, evidence/document checklists, and next-step guidance.

Phase 5 — Language Validation

Validate English and Tamil support and refine the complete system.

These five phases are the timeline proposed in the supplied PPT. No specific calendar dates or durations are given in the source material.

XIII CONCLUSION

Legal Mate AI proposes a domain-specific Artificial Intelligence system for providing accessible preliminary legal information and procedural guidance based on Indian laws. The system combines NLP-based query understanding, Retrieval-Augmented Generation, a curated Indian legal knowledge base, and a domain-specific Legal AI model.

The proposed architecture accepts legal questions or uploaded documents, identifies the relevant legal domain, retrieves appropriate information, and produces structured guidance. Intended outputs include potentially relevant legal rights, Acts and sections, document analysis, complaint drafts, evidence/document checklists, and possible next steps.

English and Tamil support are proposed to improve accessibility. The system is

designed as an information and procedural guidance tool rather than a replacement for professional legal representation.

Future implementation and evaluation are required to measure retrieval quality, query understanding, document-analysis performance, and the reliability of generated responses. With appropriate validation and continuous knowledge-base maintenance, the proposed architecture provides a framework for developing localized AI-assisted legal information services.
